Dashboard Design

Field	Details
Date	31 October 2026
Team ID	Not provided
Project Name	Health360: Clinical & Healthcare Risk Analysis
Maximum Marks	5 Marks

An effective dashboard organizes relevant information into a clear and consistent layout. Health360 uses Tableau visualizations to present sample patient demographics, lifestyle indicators and selected health measures. The dashboard is intended for exploration and comparison, not diagnosis.

Activity 1: Interactive and visually appealing dashboard

- **Clear and intuitive layout:** demographic, lifestyle and health indicators are grouped into a single dashboard.
- **Appropriate visualizations:** bar charts compare measures across age groups; a pie chart shows age-group distribution; a donut chart presents exercise levels; stacked bars and a heatmap support category comparisons.
- **Colour and theming:** distinct colors differentiate age groups and categories, while labels and legends support interpretation.
- **Interactive filters:** Tableau controls and available filters allow users to inspect displayed dimensions and focus on selected categories.
- **Comparison:** viewers can compare age groups, lifestyle categories, BMI categories and recorded outcomes.
- **Responsive access:** the companion website adapts to desktop and smaller screens; embedded Tableau content requires internet access.

Dashboard visualizations and their purpose

Chart / view	Purpose
Patient distribution by age group	Shows the proportion of records in six age groups.
Average blood pressure across age	Compares average blood-pressure values across age groups.
Age-group distribution by fatigue condition	Compares fatigue categories across the six age groups.
Exercise level distribution	Shows the distribution of three exercise-level categories.
Alcohol and smoking consumption across age groups	Compares the two lifestyle indicators by cohort.
BMI category and heart-disease views	Allows comparison of BMI categories with recorded heart-disease outcomes.
Lifestyle-risk heatmap	Provides visual comparison of lifestyle/fatigue patterns across groups.

Major outcomes / observations from the dashboard

These points describe what the dashboard displays. They are descriptive observations, not clinical conclusions:

- **Age-group representation:** six cohorts are shown: Adult, Middle Age, Old, Senior, Teenager and Young Adult.
- **Largest displayed cohort:** Teenager represents approximately 20.38% of the sample, the largest share shown.
- **Other age-group shares:** Adult 16.26%, Middle Age 16.08%, Old 15.04%, Senior 16.38% and Young Adult 15.86%.
- **Exercise distribution:** the three exercise-level categories have broadly similar displayed shares, approximately 32.94%, 33.54% and 33.52%.
- **Fatigue comparison:** the stacked bar chart presents two fatigue-condition counts for each age group.
- **Lifestyle comparison:** alcohol and smoking measures are placed side by side for each age cohort.
- **Health-indicator comparisons:** average blood pressure, BMI category and recorded heart-disease outcomes are included for visual exploration.

Activity 2: Publish dashboard on Tableau Public

The dashboard is published on Tableau Public. Open the interactive visualization using the link below:

https://public.tableau.com/views/Health360HealthcareRiskAnalysis_17932895178070/Health360HealthcareRiskAnalysis

The dashboard represents sample data and should not be interpreted as validated clinical evidence.
