Story

Field	Details
Date	31 October 2026
Team ID	Not provided
Project Name	Health360: Clinical & Healthcare Risk Analysis
Maximum Marks	5 Marks

A Tableau story presents a sequence of visualizations and explanatory text to guide viewers through an analysis. In Health360, the Patient Risk Analysis story complements the main dashboard by organizing demographic, lifestyle and health-indicator comparisons into a guided narrative.

Health360 story overview

The story moves from an overview of patient representation and clinical indicators toward lifestyle comparisons and a summary of observations. Viewers can follow the story points in Tableau Public and use the dashboard for detailed exploration.

Suggested narrative progression

Story stage	Focus	What it communicates
1. Patient and clinical overview	Patient distribution by age group and average blood pressure across age.	Introduces the sample population and compares a health measure across cohorts.
2. Lifestyle patterns	Exercise level, fatigue, alcohol and smoking comparisons.	Shows how lifestyle fields are distributed across age groups.
3. Risk-related comparisons	BMI categories and recorded heart-disease outcomes.	Allows inspection of how displayed outcomes vary across BMI categories and age groups.
4. Summary and recommendations	Descriptive observations and limitations.	Encourages careful interpretation and identifies future analysis.

Observations

- **Age-group mix:** six age cohorts are represented, with Teenager shown as the largest cohort in the age-distribution view.
- **Blood-pressure comparison:** average blood pressure by age group enables side-by-side comparison of displayed averages.
- **Fatigue patterns:** fatigue-condition counts are shown for each age cohort.
- **Exercise levels:** the donut chart shows three categories with roughly one-third of records in each displayed category.
- **Substance-use indicators:** alcohol and smoking measures are compared across the six age groups.
- **BMI and heart-disease outcomes:** category-based views allow descriptive exploration; visual association does not prove causation.

Recommendations for interpreting the story

- Use age-group charts to understand sample representation before comparing other indicators.
- Compare lifestyle categories within the same age cohort rather than assuming one factor explains a health outcome.
- Use BMI and heart-disease views as descriptive comparisons only; do not infer individual risk or causation.
- Consider dataset definitions, missing values and provenance before drawing stronger conclusions.
- For future work, use a documented, ethically sourced and appropriately de-identified dataset.

Activity 2: Publish story on Tableau Public

The Health360 Patient Risk Analysis story is published on Tableau Public. Open it using the link below:

Important note

The story and dashboard use a 5,000-record sample dataset as described in the project materials. These are not verified clinical patient records. Health360 is for educational data exploration only.
